

Approving a new manual

Verbatim · version-scoped Q&A over psychological test-manual PDFs

App: <https://chiragsingla25.github.io/verbatim/> — internal contributor guide

This guide covers **reviewing and publishing** a manual that has already been uploaded. Uploading is a separate step; this picks up once a manual version exists and is waiting for review.

Who can do this

Only a **contributor** or **admin** account. New sign-ups are *students* (read and ask only); an administrator grants contributor access. If **/upload** or a review page shows **“Not available”**, your account is not a contributor yet.

Before you start

Someone has uploaded a manual. Its version shows status **pending** and an ingestion job is running — Docling parses the PDF, extracts tables, and builds the search index. This usually takes 2–3 minutes.

Step 1 — Open the review screen

- 1 Sign in at <https://chiragsingla25.github.io/verbatim/>.
- 2 Go to **Manual library** (the default screen).
- 3 Find the pending version:
 - If **you** uploaded it, it appears under **“Your uploads in progress”** with a **pending · Review** → link.
 - Otherwise (an admin, or another contributor's upload) open it directly at `.../verbatim/review/<version-id>`.

Step 2 — Wait for ingestion to finish

The review screen refreshes itself while parsing. It is ready to review when the **Ingestion** pill reads **review**.

Pill says	Meaning
queued / parsing	Still working — wait, the page updates on its own.
review	Ready. Proceed to Step 3.
failed	Parsing failed — the error is shown. Usually the PDF is encrypted or not a real PDF. Fix the file and re-upload; there is nothing to approve.

Step 3 — Check the extraction against the source

This is the important part. **A wrong number in a norm or cut-off table becomes a wrong answer** for every student who asks about it.

- 1 **OCR quality** — shown as a percentage; higher is better. A **low_ocr** flag (below 80%) means scanned or poor-quality pages — spot-check those closely.
- 2 **Flags** — investigate any of: **encrypted_pdf** (file is protected; cannot be indexed), **no_tables_found** (suspicious for a manual with norm / cut-off tables), **low_ocr** (see above).
- 3 **Extracted tables** — the screen lists every table block the parser found. Click “**Open the source PDF** ↑” (and the per-table “view page in source” links) and compare each extracted block to the actual page:
 - Norm tables — every mean / SD / percentile cell.
 - Score cut-offs and severity / classification bands.
 - Row and column labels line up with the source.

If anything is wrong, **Reject** (Step 4) and ask the uploader to fix and re-upload — you cannot edit cells in v1.

Step 4 — Decide

Approve & publish version

- the version flips to **active**;
- it appears in every user’s library and the Ask version list **immediately**;
- students can ask questions against it right away;
- an entry is written to the audit log under **your** identity.

Reject upload

- you are prompted for a reason (optional);
- the version is marked **rejected** and stays unpublished.

After publishing

- The manual is live for everyone. No further action is needed.
- **There is no un-publish or archive in v1.** To correct a published manual, upload a **new version** of it — the old one stays for the audit trail.
- **One PDF per version.** A different edition, printing, or corrected scan is a new version, uploaded separately.

Troubleshooting

Symptom	Cause / fix
---------	-------------

Job stuck in parsing for more than ~5 minutes	The ingestion GitHub Action may have failed. Check the repo's Actions → ingest run. Re-uploading the PDF re-triggers it.
No Review → link on a pending version	You are neither the uploader nor an admin. Ask the uploader or an admin to review it.
“Not available” on /upload or /review	Your account is a <i>student</i> . An administrator must promote it to <i>contributor</i> .
failed with “encrypted” or “not a PDF”	The source file is protected or corrupt. Get an unprotected PDF and re-upload.
